

(Hausdorff)

9

27/9

Locally compact abelian groups.

We compute RHom between LCA. LCA don't form an abelian cat., by RHom we mean RHom for $\text{Cond}(Ab)$. (Pointset topology exercise: locally compact \Rightarrow compactly generated.)

Def. $X \in \text{Top}$ is locally compact: X is Hausdorff and any $x \in X$ has open U , compact K s.t. $x \in K \subseteq U$.

1. Recall \otimes Complement on $\text{Cond}(Ab)$.

① \otimes is sheafification of $S \mapsto M(S) \otimes N(S)$ for $M, N \in \text{Cond}(Ab)$, $S \in \text{CHaus}$.

• $\forall T_i \in \text{Cond}$, $\mathbb{Z}[T_1] \otimes \mathbb{Z}[T_2] = \mathbb{Z}[T_1 \times T_2] \in \text{Cond}(Ab)$

(check: \dashv LHS(S) =, on presheaf level,

$$\text{LHS}(S) = \mathbb{Z}[\text{Map}(S, T_1)] \otimes \mathbb{Z}[\text{Map}(S, T_2)] = \mathbb{Z}[\text{Map}(S, T_1) \times \text{Map}(S, T_2)] = \mathbb{Z}[\text{Map}(S, T_1 \times T_2)] = \text{RHS}(S)$$

where Map means map in Top)

• $\forall T \in \text{Cond}$, $\mathbb{Z}[T]$ is flat.

(because, on presheaf level,

$$A \otimes \mathbb{Z}[T]: S \mapsto A(S) \otimes \mathbb{Z}[\text{Map}(S, T)] \text{ and this is exact since } \mathbb{Z}[\text{Map}(S, T)] \in Ab \text{ is free.)}$$

② For $M, N \in \text{Cond}(Ab)$, $\text{Hom}(M, N) \in Ab$.

There is a natural way to enrich it to a $\text{cond}(Ab)$, i.e. defining an internal Hom:

$$\forall P \in \text{Cond}(Ab), \text{Hom}(P, \text{Hom}(M, N)) \cong \text{Hom}(P \otimes M, N)$$

$$\left(\text{Cond}(Ab) \begin{array}{c} \xrightarrow{\otimes M} \\ \perp \\ \xleftarrow{\text{Hom}(M, -)} \end{array} \text{Cond}(Ab) \right)$$

• Take $P = \mathbb{Z}[S]$, $S \in \text{CHaus}$, get

$$\text{Hom}(\mathbb{Z}[S], \text{Hom}(M, N)) \cong \text{Hom}(\mathbb{Z}[S] \otimes M, N)$$

$$\text{Hom}(S, \text{Hom}(M, N))$$

$$\text{Hom}(M, N)(S)$$

for top. gp. A, B , endow $\text{Hom}(A, B)$ with compact-open topology. (PSTop exercise: $\forall S \subseteq \text{Top}$.
~~Map~~ $\text{Map}: S \rightarrow \text{Home}(A, B)$ ~~continuous~~
 $\Leftrightarrow S \times A \rightarrow B$ continuous.

Question: Is $\underline{\text{Hom}}(M, N) \cong \underline{\text{Hom}}(M, N)$? where RHS is discrete

Partial answer: NO. Hom remembers "topology" of M, N :

Prop $A, B \dots$ Hausdorff top. ab. gp.,
 A compactly generated (as top. sp.)

Then \exists natural iso.

$$\underline{\text{Hom}}(A, B) \xrightarrow{\cong} \underline{\text{Hom}}(A, B) \quad (\text{Hom}(A, B) \text{ is with comp-open top.})$$

proof: $\forall S \in \text{Haus}$, $\underline{\text{Hom}}(A, B)(S) = \underline{\text{Hom}}(A \otimes \mathbb{Z}[S], B)$.
 go further: $\underline{\text{Hom}}(A, B)(S) = \text{Map}(S, \text{Hom}(A, B)) = \text{Map}(A \times S, B)$.

Notice surjection $\mathbb{Z}[A] \rightarrow A \rightarrow 0$ (this means $[a] \mapsto a \dots$ 'universal' for A).

$$\forall S \in \text{Haus}, \text{ExtDis} \quad \begin{array}{c} \mathbb{Z}[A](S) \rightarrow A(S) \rightarrow 0 \\ \parallel \qquad \qquad \parallel \\ \mathbb{Z}[\text{Map}(S, A)] \quad \text{Map}(S, A) \\ [a] \mapsto a, \text{ here } a \in \text{Map}(S, A) \end{array}$$

$$\text{So } \mathbb{Z}[A \otimes \mathbb{Z}[S]] \rightarrow \mathbb{Z}[A \otimes \mathbb{Z}[S]] \rightarrow 0 \quad (\mathbb{Z}[S] \text{ flat})$$

$$\parallel \qquad \qquad \parallel$$

$$\mathbb{Z}[A \times S]$$

So any element in $\underline{\text{Hom}}(A \otimes \mathbb{Z}[S], B)$ induces an element in $\underline{\text{Hom}}(\mathbb{Z}[A \times S], B)$ which by adjunction = $\text{Map}(A \times S, B)$ again by adjunction = $\text{Map}(A \times S, B)$ in Top.

This is clearly injective.

To show surjectivity, need to show: given map $A \times S \rightarrow B$, the induced map $\mathbb{Z}[A \times S] \rightarrow B$ factors through $A \otimes \mathbb{Z}[S]$, i.e. $\ker(\mathbb{Z}[A] \rightarrow A) \otimes \mathbb{Z}[S]$ is "mapped to 0", i.e. $\mathbb{Z}[A \times A] \otimes \mathbb{Z}[S] \rightarrow \mathbb{Z}[A] \otimes \mathbb{Z}[S] \rightarrow B$

composition is 0, where

$$\begin{array}{c} \mathbb{Z}[A \times A] \rightarrow \mathbb{Z}[A] \rightarrow A \rightarrow 0 \\ [(a, b)] \mapsto [a+b] - [a] - [b] \end{array}$$

But $\mathbb{Z}[A \times A \times S] \longrightarrow \mathbb{Z}[A \times S] \longrightarrow B$
 $\Leftrightarrow A \times A \times S \longrightarrow A \times S \longrightarrow B$
 $(a, b, s) \mapsto (ab - a - b, s)$
 $(0, s) \mapsto 0$ (since $(A \times S \rightarrow B) \sim (S \rightarrow \text{Hom}(A, B))$)

③ Form $D(\text{Cond}(Ab))$. Use projective resolutions to define RHom , \otimes^L .
 Define internal RHom via: $\forall P \in D^-(\text{Cond}(Ab))$,
 $\text{Hom}(P, \text{RHom}(M, N)) \cong \text{Hom}(P \otimes^L M, N)$.
~~Take P as resolution, get RHom(M, N) = Hom(P \otimes^L M, N)~~
 Our goal is to compute $\text{RHom}(LCA, LCA)$.

⊕ "Recall" def. of condensed cohomology:
 $T \in \text{Cond}$, $M \in \text{Cond}(Ab)$.
 $\cdot \Gamma^i(T, M) := \text{Hom}_{\text{Cond}}(T, M) \stackrel{\text{adj}}{=} \text{Hom}_{\text{Cond}(Ab)}(\mathbb{Z}[T], M) \in Ab$
 $\cdot \text{RP}^i(T, M) := \text{RHom}_{\text{Cond}(Ab)}(\mathbb{Z}[T], M)$, where we use proj. res. w.r.t. $\mathbb{Z}[T] \in D(\text{Cond}(Ab))$
 $H_{\text{Cond}}^i(T, M) := H^i(\text{RHom}(\mathbb{Z}[T], M))$

Previous talk showed: for $T \in$ locally compact Hausdorff, M discrete,
 ~~$H_{\text{Cond}}^i(T, M) \cong H_{\text{sheaf}}^i(T, M)$~~
 ~~$\text{RP}^i(T, M) \cong \text{RP}_{\text{sheaf}}^i(T, M)$~~

Q: $\cdot \text{RHom}(\mathbb{Z}[T], M)$ as a refinement of $\text{RP}^i(T, M)$?
 \cdot the "topology" of $\mathbb{Z}[T] \in \text{Cond}$, for T locally compact Hausdorff?

2. Now compute $R\text{Hom}(LCA, LCA)$.

"Recall":

Thm i) Any LCA is an extension of \mathbb{R}^n , discrete compact.

ii) Pontryagin $\mathbb{D}: A \mapsto \text{Hom}(A, \mathbb{T})$ well-defined on LCA. \mathbb{D}^2 is iso., switches ~~dis.~~ dis. - comp.

So we can make various reductions:

- by i), reduce to \mathbb{R} , dis., comp.
- any discrete M has $0 \rightarrow \mathbb{Z}^{\oplus J} \rightarrow \mathbb{Z}^{\oplus I} \rightarrow M \rightarrow 0$

so reduce to $\mathbb{Z}^{\oplus I}$

$$0 \rightarrow \mathbb{Z}^{\oplus J} \rightarrow \mathbb{Z}^{\oplus I} \rightarrow M \rightarrow 0$$

$\downarrow \quad \quad \quad \downarrow$
 $\mathbb{Z} \quad \quad \quad \mathbb{Z}$
 $\downarrow \quad \quad \quad \downarrow$
 $\mathbb{T} \quad \quad \quad \mathbb{T}$

$\text{RHom}(\mathbb{Z}^{\oplus I}, M) \cong \prod_I M$

- any compact M has $0 \rightarrow \mathbb{Z}^{\oplus J} \rightarrow \mathbb{Z}^{\oplus I} \rightarrow \text{Hom}(M, \mathbb{T}) \rightarrow 0$

apply \mathbb{D} get

$$0 \rightarrow M \rightarrow \mathbb{T}^I \rightarrow \mathbb{T}^J \rightarrow 0$$

So reduce to \mathbb{T}^I , arbitrary I .

- $0 \rightarrow \mathbb{Z} \rightarrow \mathbb{R} \rightarrow \mathbb{T} \rightarrow 0$ relates $\mathbb{Z}, \mathbb{R}, \mathbb{T}$.

In essence there are ~~two~~ ^{two (more)} things to compute:

- (*) $R\text{Hom}(\mathbb{T}^I, M)$ M dis. ($R\text{Hom}$ commutes with limit in second variable)
- $R\text{Hom}(\mathbb{T}^I, \mathbb{R})$
- ~~$R\text{Hom}(\mathbb{Z}^I, M)$ M dis.~~
- ~~$R\text{Hom}(\mathbb{Z}^I, \mathbb{R})$~~

⊙ Idea: recall $R\text{Hom}(\mathbb{Z}[T], M)(S) = R\text{Hom}(\mathbb{Z}[T \times S], M) = R\Gamma(T \times S, M)$, which we know from sheaf coho.

We will relate (*) to these, using

FAET In Ab, \exists functorial res.

$$\dots \rightarrow \bigoplus_{j=1}^n \mathbb{Z}[A^{r_{i,j}}] \rightarrow \dots \rightarrow \mathbb{Z}[A^2] \rightarrow \mathbb{Z}[A] \rightarrow A \rightarrow 0$$

Remark • [Xena, Jan 2021] mentions the res. can be explicitly constructed.
 • Functoriality implies similar res. for $\text{Cnd}(A \oplus B)$.
 But Note this won't be a projective res. in general unless all $A^{r_{ij}}$ are Ext-D's. (for $\text{Cnd}(A \oplus B)$)

① $\text{RHom}(T^I, M) = \bigoplus_I \text{Ext}^i(M, N)$ d.s.

• I finite: reduces to $I = \{r\}$. We show $\text{RHom}(R, M) = 0$ and use $0 \rightarrow Z \rightarrow R \rightarrow T \rightarrow 0$.

Apply FACT to $R \rightarrow 0$:

$$\begin{array}{ccccccc} \cdots & \rightarrow & \bigoplus_{j=1}^{n_j} Z[\mathbb{R}^{r_{ij}}] & \rightarrow & \cdots & \rightarrow & R \rightarrow 0 \\ & & \downarrow & & & & \downarrow \\ \cdots & \rightarrow & \bigoplus Z[0^{r_{ij}}] & \rightarrow & \cdots & \rightarrow & 0 \rightarrow 0 \end{array}$$

If these were proj. res. then we may apply $\text{RHom}(-, M)$ and we are done. But upper row is not, so we should take proj. res. then $\text{RHom}(-, M)$.
 You might ask: why not take proj. res. of R directly. This is because:

Aside.

FACT' (Cartan-Eilenberg resolution)

$F: A \rightarrow B$ left exact between contravariant between abelian cat.

$K_{\bullet \geq 0}$ a complex in A .

- Then \exists a double complex $P_{\bullet, \bullet}$ functorial w.r.t. K and
- each term is projective. nonzero only in first quadrant. (i.e. $\bullet \geq 0$)
 - $\text{Tot}(P_{\bullet, \bullet}) \rightarrow K_{\bullet}$ is a projective res. of K_{\bullet} .
 - the spectral seq. associated to $F(P_{\bullet, \bullet})$ satisfies

[015G]
 [Weibel §5]

$$E_1^{p,q} = R^q F(K_p^\#) \Rightarrow H^*(F(\text{Tot}(P_{\bullet,\bullet}))) = R^* F(K_\bullet)$$

(F means filtration by columns)

Apply this to

$$R\text{Hom}(-, M) : \text{Cond}(Ab) \rightarrow Ab$$

$$K_\bullet = (0 \leftarrow A \leftarrow \mathbb{Z}[A] \leftarrow \dots \leftarrow \bigoplus \mathbb{Z}[A^{n_j}] \leftarrow \dots) \otimes \mathbb{Z}[S]$$

we get a spectral seq.

$$E_1^{p,q} = R^q \text{Hom}(\bigoplus_{j=1}^{n_p} \mathbb{Z}[A^{r_{p,j}}] \times S, M)$$

$\left(\begin{array}{l} A \in \text{Cond}(Ab) \\ S \in \text{CHaus} \\ M \in \text{Cond}(Ab) \end{array} \right)$

$$= \prod_{j=1}^{n_p} H^q(A^{r_{p,j}} \times S, M) \Rightarrow R^* \text{Hom}(K_\bullet, M)$$

$$= R^* \underline{\text{Hom}}(A, M)(S)$$

note i) K_\bullet is q's to $A[0]$
 ii) $\underline{\text{Hom}}(A, M)(S) = \text{Hom}(A \otimes \mathbb{Z}[S], M)$
 $\Rightarrow R\underline{\text{Hom}}(A, M)(S) = R\underline{\text{Hom}}(A \otimes \mathbb{Z}[S], M)$

In our situation $\mathbb{R} \rightarrow 0$, we get spectral seq.

$E_{1,\mathbb{R}}^{p,q}$ and $E_{1,0}^{p,q}$ converging to $R^* \underline{\text{Hom}}(\mathbb{R}, M)(S)$ and 0 respectively.

We show the induced $E_{1,\mathbb{R}}^{p,q} \leftarrow E_{1,0}^{p,q}$ is a q's.
 an iso. because

$$H^q(\mathbb{R} \times S, M) \xleftarrow{\sim} H^q(S, M) \text{ as sheaf coho.}$$

• I infinite: suffices to show

$$\text{colim}_{\substack{J \subseteq I \\ \text{finite}}} R\underline{\text{Hom}}(T^J, M) \xrightarrow{\sim} R\underline{\text{Hom}}(T^I, M)$$

because LHS $\stackrel{\text{above}}{\cong} \text{colim}_J \bigoplus M[E_i] \cong \bigoplus_I M[E_i]$

- Apply FACT to $\mathbb{T}^J \xleftarrow{\text{proj}} \mathbb{T}^I$. As above, everything reduces to

$$\text{colim}_{\substack{J \subseteq I \\ \text{finite}}} H^q(\mathbb{T}^J \times S, M) \xrightarrow{\sim} H^q(\mathbb{T}^I \times S, M)$$

which is true for sheaf cohs. \square

② $\text{RHom}(\mathbb{T}^I, \mathbb{R}) = 0$. Omit.

③ $\text{RHom}(\mathbb{Z}^I, M) = \bigoplus_I M$, M drs.

IRRELEVANT

Use same proof as ① we can show $\text{RHom}(\mathbb{R}^I, M) = 0$.
 Then ~~apply~~ ^{use} $0 \rightarrow \mathbb{Z}^I \rightarrow \mathbb{R}^I \rightarrow \mathbb{T}^I \rightarrow 0$. (Note: this is exact for arbitrary I because $AB4^*$ holds in $\text{Cond}(Ab)$)

Apply $\text{RHom}(-, M)$:

$$\text{RHom}(\mathbb{Z}^I, M) = \text{cone}(\bigoplus_I M \text{EII} \rightarrow 0) = \bigoplus_I M$$

~~$\text{RHom}(\mathbb{R}^I, M) = 0$~~

Consequences: $\text{RHom}(A, B)$

a) (drs., drs.) $0 \rightarrow \bigoplus^I \mathbb{Z} \rightarrow \bigoplus^J \mathbb{Z} \rightarrow A \rightarrow 0$

$\leadsto \text{RHom}(A, B) = \text{cocone}(B^J \rightarrow B^I)$

b) (comp., drs.) $0 \rightarrow A \rightarrow \mathbb{T}^I \rightarrow \mathbb{T}^J \rightarrow 0$

$\leadsto \text{RHom}(A, B) = \text{cocone}(\bigoplus_I B \text{EII} \rightarrow \bigoplus_J B \text{EII})$

c) (\mathbb{R} , drs.) 0

d) (drs., comp.) as a)

e) (comp., comp.) as b) $\leadsto = \text{cocone}(\text{RHom}(\mathbb{T}^J, B) \rightarrow \text{RHom}(\mathbb{T}^I, B))$

$\text{RHom}(\mathbb{T}^I, B) = \text{cocone}(\text{RHom}(\mathbb{T}^I, \mathbb{T}^{I'}) \rightarrow \text{RHom}(\mathbb{T}^I, \mathbb{T}^{I''}))$

$\text{RHom}(\mathbb{T}^I, \mathbb{T}^J) = \text{RHom}(\mathbb{T}^I, \mathbb{T}^J)$

$\text{RHom}(\mathbb{T}^I, \mathbb{T}) = \text{cone}(\bigoplus_I \mathbb{Z} \text{EII} \rightarrow 0) = \bigoplus_I \mathbb{Z}$

f) $(\mathbb{R}, \text{comp.})$ as c)

g) $(\text{dis.}, \mathbb{R})$ as a)

h) $(\text{comp. } \mathbb{R})$ 0

i) (\mathbb{R}, \mathbb{R}) use $0 \rightarrow \mathbb{Z} \rightarrow \mathbb{Q} \rightarrow \mathbb{T} \rightarrow 0 \rightsquigarrow = \mathbb{R}$

Cor Ext ^{≥ 2} $(A, B) = 0$ for A, B LCA.

Added:

$0 \rightarrow Z \rightarrow R \rightarrow T \rightarrow 0$ is exact as abelian groups. They are still exact as condensed abelian groups. To see this, it suffices to check by evaluating on extremally disconnected groups, which in turn is an exercise in point set topology. [For details, see, e.g. arxiv: 2109.07816, Prop. 2.18]
